

In this project I had to make some pretty interesting design choices, in the beginning, I wanted to compare the data of the individuals that had overturned convictions vs those who have not had their convictions overturned but the two files are not directly comparable to the convictions file being coded. Originally I was going to create a dictionary to be able to decode the convictions table but what I decided to do was just compare the factors that were most common in overturned data. This made things much easier! I compared it to the state, Sex, and race.

One thing that I thought was interesting is the highest probability of overturned convictions are Hispanic males in Indiana
